The present invention describes primer sets for synthesising 5602 (ill-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence of an oligonucleotide which comprises a 3'-end sequence complementary to a polynucleotide which comprises at 3'-end sequence. Where the oligonucleotide which comprises as 1'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the action and/or diagnosis of the abnormality of the full-length cDNAs are primers allow obtaining of the full-length cDNAs asily without any specialised methods. AAH13628 and AAH13633 to AAH13632 to AAH13632 represent human amino acid sequences; and AAH13632 to AAH13632 represent human amino acid sequences; and AAH13632 to AAH13632 represent human amino acid sequences; and the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       180

The present sequence is that of human serine racemase, an enzyme that catalyses the conversion of L-serine to D-serine. Neuron damage following various nervous system diseases is often caused by a ctivation of glutamate N-methyl-D-aspartate (NMDA) receptors in the brain. This receptor is activated by the binding of D-serine. Regulation of D-serine levels through regulation of Serine. Regulation of D-serine levels through regulation of Serine and therefore prevent or minimise neuron damage in neurogenic and may therefore prevent or minimise neuron damage in neurogenic and disease and Parkinson's disease, and disorders leading to peripheral and chronic pain. The invention provides serine racemase polypeptides and methods for their recombinant production. These polypeptides are used in claimed methods of screening for agents that modulate or decrease serine racemase activity. A claimed pharmaceutical composition comprising either an expression vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynucleotide encoding serine racemase enzyme and the enzyme useful for screening reagents regulating the activity of the enzyme in a neuron disease caused by over- or under-activation of glutamate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           that contains a serine racemase polynucleotide, or a reagent that modulates serine racemase enzyme activity, is used to modulate serine racemase activity in a disease, particularly neuron damage or a neurodegenerative disease caused by the over- or under-activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "cysteine synthase/cystathione beta-synthase

                                                                  (NMDA) receptors. The mammalian serine racemases can be used to identify modulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N-methyl-D-aspartate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone
                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                 The present sequence represents a manmalian serine racemase, which has a specific activity of at least 0.003 micromole L-serine/mg/hour. The enzyme catalyses the direct racemisation of L-serine to D-serine.

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90404) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colliss; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LNAVRSLVPDALERKPKAVVTHSSGNHGQALTYAAKLEGIPAYIVVPQTAPDCKKLAIQA 120

polypeptide (II) sequences. (II) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (III). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. He polypeptide and polymucleotide sequences have applications in the polyperide and polymucleotide sequences have applicated activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SKLKGKLMPNLYPPETIADGVK-SSIGLNTWPIIRDLVDDIFTVTEDEIKCATQLVWERM 278

It lacks the chloroplast transit peptide of the mutant TD precursor, and is encoded by a polynucleotides (see AAX25334) that is one of 9 claimed polynucleotides (see AAX25332 (comrl/omrl), which encode a feedback insensitive TD. These polynucleotides can be used to transform a wide variety of plants, fungi, bacteria and yeast. The polynucleotides differ from the wild-type only by 2 point mutations, which result in R499C and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New sequences encode mutant threonine dehydratase/deaminase - which is insensitive to feedback inhibition, useful as a selective marker to produce transformed cells resistant to toxic isoleucine analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Threonine dehydratase/deaminase; omr1 gene; feedback inhibition; transgenic plant; selectable marker; isoleucine; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Feedback insensitive mature threonine dehydratase/deaminase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a mutant Arabidopsis thaliana threonine dehydratass/deaminase (TD) protein of the invention. The protein is a feedback insensitive mutant. The TD DNA sequence is used as molecular marker (imparting resistance to toxic structural analogues of isoleucine) for selecting transformed cells and to produce transformants with increased levels of isoleucine (and thus better nutritional value) or of intermediates in biosynthesis of isoleucine (e.g. 2-oxobutyrate, for synthesis of the degradable biopolymer poly(hydroxybutyrate). Also TD-expressing plants permit use of the isoleucine structural analogues as herbicides. The DNA sequences are alternatives for antibiotic resistance markers (which are potentially harmful to the environment). Since no human analog of TD exists (humans can not synthesize isoleucine), it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  TEGI-MVHPNQEPAVIAGOGTIALEVLNQV--PLVDALVVPVGGGGMLAGIAITVKALKP 202

                                                                                                                                                                                                                                                                                           Gaps
          TD) in the R4 and R6 regulatory regions. These forms of TD are not only insensitive to feedback inhibition by isoleucine, but are also insensitive to feedback inhibition by isoleucine, but are also insensitive to structural analogues of isoleucine that are toxic to plants and microorganisms which synthesise only wild type TD.

Nucleotide sequences encoding mutated forms of TD can therefore be used to create cells that are insensitive to compounds normally toxic to cells expressing only wild-type TD enzymes, and thus may be used to provide a biochemical selectable marker. Transformants harboring a nucleotide sequence comprising a promoter operably linked to a mutated TD sequence demonstrate increased levels of isoleucine production, and thus provide an improved nutrient source.

dehydratase/deaminase (TD) protein of the invention. The protein is a feedback insensitive mutant. The TD DNA sequence is used as molecular marker (imparting resistance to toxic structural analogues of isoleucine) for selecting transformed cells and to produce transformants with increased levels of isoleucine (and thus better nutritional value) or of intermediates in biosynthesis of isoleucine (e.g. 2-oxobutyrate, for synthesis of the degradable blopolymer poly(hydroxybutyrate). Also FD-expressing plants permit use of the isoleucine structural analogues as herbicides. The DNA sequences are alternatives for antibiotic resistance markers (which are potentially harmful to the environment). Since no harm a malog of FD exists (humans can not synthesize isoleucine), it

dehydratase/deaminase (TD) protein of the invention. The protein is a feedback insensitive mutant. The TD DNA sequence is used as molecular marker (imparting resistance to toxic structural analoques of isoleucine) for selecting transformed cells and to produce transformants with increased levels of isoleucine (and thus better nutritional value) or of intermediates in biosynthesis of isoleucine (e.g. 2-oxobutyrate). Also synthesis of the degradable biopolymer poly(hydroxybutyrate)). Also TD-expressing plants permit use of the isoleucine structural analogues as markers (which are potentially harmful to the environment). Since no human analog of TD exists (humans can not synthesize isoleucine), it
                                                                                                                                              Threonine dehydratase/deaminase; TD; feedback insensitive mutant; molecular marker; isoleucine toxic structural analog resistance; isoleucine production; biosynthesis; degradable biopolymer; herbicide; polyhydroxybutyrate; antibiotic resistance marker; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents an Arabidopsis thaliana mutant mature threonine dehydratase/deaminase (TD) which, unlike the wild-type enzyme (see AAXO5702), is insensitive to feedback inhibition by isoleucine. It lacks the chlorophast transit peptide of the mutant TD precursor, and is encoded by a polynucleotide (see CAAX25335) that is one of 9 claimed polynucleotides (see AAX25332-40), originally isolated and cloned from A. thaliana mutant line GMILD (omr1/omr1), which encode a feedback insensitive TD. These to polynucleotides can be used to transform a wide variety of plants, fungl, bacteria and yeast. These polynucleotides differ from the wild-type only by 2 point mutations, which result in R499C and C R554H amino acid substitutions (numbering according to wild-type TD) in the R4 and R6 regulatory regions. These forms of TD are not only insensitive to feedback inhibition by isoleucine, but are also insensitive to eceback inhibition by isoleucine, but are also insensitive to a structural analogues of isoleucine that are toxic to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            86 NHGQALTYAAKLEGIPAYIVVPQTAPDCKKLAIQAYGASIVYCEPSDESRENVAKRVTEE 145

insensitive to feedback inhibition, useful as a selective marker
produce transformed cells resistant to toxic isoleucine analogues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plants and microorganisms which synthesise only wild-type TD.

Nucleotide sequences encoding mitated forms of TD can therefore be used to create cells that are insensitive to compounds normally toxic to cells expressing only wild-type TD enzymes, and thus may be used to provide a biochemical selectable marker. Transformants harboring a nucleotide sequence comprising a promoter operably linked to a mutated TD sequence demonstrate increased levels of isoleucine production, and thus provide an improved nutrient source.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels 42;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
